ALIGNMENT INSTRUCTIONS • MULTIPLEX SECTION

GENERAL

The preferred alignment procedure, described in Table 1 below, makes use of a multiplex generator with an RF output. For optimum performance, it is desirable to align the multiplex unit while it is connected to the tuner with which it will be used. Before aligning the multiplex section, it is wise to check the alignment of the IF stages, since poor IF alignment can make proper multiplex operation impossible.

The procedure in Table 1 is based upon the use of a FISHER Model 300 multiplex generator. An alternate procedure, for use with MPX generators having no RF output, is given in Table 2.

TEST EQUIPMENT REQUIRED: MULTIPLEX GENERATOR, AC VACUUM TUBE VOLTMETER (RMS PREFERRED), 100 KC OSCILLOSCOPE WITH EXTERNAL SWEEP FACILITIES.

NOTE: USE HEX ALIGNMENT TOOL ONLY FOR ADJUSTING COIL SLUGS

TABLE 1

STEPS	GENERATOR		R F DEVIATION	INDICATOR TYPE AND CONNECTION	ALIGNMENT	
	CONNECTION	MODULATION			ADJUST	INDICATION
1	Multiplex generator RF output to antenna terminals	19 kc pilot only	± 7.5 kc	VTVM to TP 1	Z1 top and bottom	Maximum reading on VTVM
2	19 kc output of generator to oscilloscope horizontal input; generator not connected to MPX section	————	————	Vertical input of oscilloscope for external sweep	Z2	Set frequency of free-running oscillator as close as possible to 38 kc. Lissajous pattern (see figure 1, on schematic) should be as slow-moving as possible.
3	Same as Step 1	Composite MPX; 1000 cps on left channel only	± 75 kc	VTVM and oscilloscope vertical input to right channel output lug (terminal 1R)	Z1 top	Maximum reading on VTVM; clean 1000 cps sine wave on oscilloscope
4	Same as Step 1	Composite MPX; 1000 cps on right channel only	± 75 kc	Same as Step 3	MPX separation control (R4)	Minimum reading on VTVM should be at least 33 db below reading obtained in Step 3
5	Same as Step 1	Same as Step 4	± 75 kc	VTVM and oscilloscope vertical input to right channel output lug (terminal 1S)	————	Same VTVM reading as obtained in Step 3 ± 2 db; clean 1000 cps sine wave on oscilloscope
6	Same as Step 1	Composite MPX; 1000 cps on left channel only	± 75 kc	Same as Step 5	MPX separation control (R4), if necessary*	Minimum reading on VTVM should be at least 33 db below reading obtained in Step 5.

* If adjustment is required, adjust for best compromise readings in Steps 4 and 6.

ALTERNATE ALIGNMENT PROCEDURE For multiplex generators without an RF output

In this procedure, it is necessary to disconnect the ratio detector from the multiplex unit before proceeding. Place a 12K resistor in series with the generator and MPX input, and place a 180 pF capacitor from the hot side of the input to ground. This forms a low-pass filter which simulates the effect of the tuner on the multiplex signal.

NOTE: USE HEX ALIGNMENT TOOL ONLY FOR ADJUSTING COIL SLUGS

TABLE 2

STEPS	GENERATOR			INDICATOR TYPE AND CONNECTION	ALIGNMENT

* If adjustment is required, adjust for best compromise readings in Steps 4 and 6.

ALIGNMENT INSTRUCTIONS

Read These Instructions With Extreme Care Before Attempting Alignment.

CHASSIS: Turn the station selector completely counterclockwise, without forcing. Dial pointer should be at zero index mark on logging scale. If not, reset the dial pointer. Disconnect the external antennas and the antenna link. Set Ferrite Loop to normal position, parallel to rear panel. When using an oscilloscope for alignment, set the output level controls for no overload, as shown by the proper waveform shape. Connect loads to main output and turn volume control to minimum.

SIGNAL GENERATORS: The signal generator equipment must be able to supply the following: FM RF modulated 30% (± 22.5 KC deviation) at 400 cps; AM RF modulated 30% at 400 cps;

AM IF with 30KC sweep for AM bandwidth adjustment.

INDICATOR: DC VTVM, AC VTVM, and scope for alignment.

ALIGNMENT: Allow the chassis and test instruments to warm up for at least fifteen minutes. Adjust the line voltage for 117 volts AC, 50-60 cycles. Use fully insulated tools: a small screwdriver for all trimming capacitors; a K-Tran tool for Z1, Z2, Z3, Z4; a hex tool for L1, L2, L5, L6, L10, Z6 and Z5. For AM alignment, short AVC lead to ground.

NOTE: For calibrating both the AM and FM, use as low an output voltage as possible from your signal generator.
