

Dual Monitor Startup Timing Field Repair

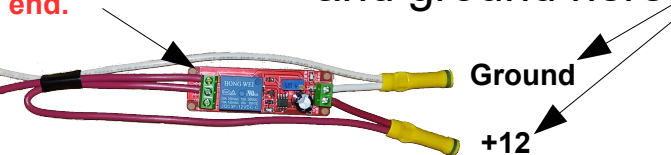

1) Cut existing wires and connect output of Module here

This timing circuit provides a 10-15 second delay between the time it receives power and the time it supplies power to the output. This forces the rear monitor to become the 'secondary' device. This corrects the operation of the two monitors.

Note 3 terminals and relay at this end.

2) Reattach power and ground here

Make sure mating wire colors match
